

# FloodGuard Miami

*Predict. Prepare. Protect.*

Smart, no-code flood risk platform for Miami's communities

Presented by:

**Mostafa Sameer** — Civil Engineering Innovator

# The Problem

- Miami is one of the **most flood-prone cities in the U.S.**
  - Even *sunny-day flooding* affects neighborhoods like Brickell and Little River.
  - Existing FEMA maps are **outdated, reactive, and not localized.**
- City planners, residents, and businesses **lack real-time flood risk data.**

- Sea level projected to rise **14–26 inches by 2060.**
- Over **\$3B allocated** to flood resilience in Miami-Dade 2030 Plan.
- Demand for **predictive, affordable flood tools** is growing across South Florida.

## Miami Mayor: City Flooding “Like a Hurricane” Again Today Thanks to King Tides

Thanks to sea-level rise, Florida's unique topography, and poor city planning, areas of Miami-Dade County look like a hurricane hit them today. But there's not even a tropical storm in town. Instead, mere weeks after a real hurricane did damage major parts of South Florida, the Miami area is massively flooding thanks to a combination of some moderate storms hitting during king tides, when the sea is at its highest point all year.

By Jerry Iannelli | October 5, 2017

# Our Solution: FloodGuard Miami

**FloodGuard Miami** is a no-code  
**flood prediction and alert**  
**platform** combining:  
Real-time **open data** (NOAA,  
USGS, rain gauges)  
**Community flood reports** via  
mobile app  
**AI-driven risk scoring** for  
neighborhoods

Image Taken: <https://climatecenter.fsu.edu/topics/sea-level-rise>

# How It Works

- Collects rainfall & tide data from open APIs
- Integrates local flood reports from users
  - Predicts next 24–48 hr flood risks via simple no-code AI workflows
- Displays alerts + visualization on a public map

# Market & Audience

## ❑ Segment

❑ City Governments

❑ Real Estate / Insurance

❑ Residents / NGOs

## ❑ Value

❑ \$10M+ in flood mapping contracts

❑ \$1.5B+ market

❑ Awareness + safety

## ❑ Target

❑ Miami-Dade, Fort Lauderdale

❑ Developers & agents

❑ General users

# Business Model

| <input type="checkbox"/> Tier            | <input type="checkbox"/> Description                          | <input type="checkbox"/> Pricing        |
|------------------------------------------|---------------------------------------------------------------|-----------------------------------------|
| <input type="checkbox"/> Free Tier       | <input type="checkbox"/> Public flood alerts                  | <input type="checkbox"/> \$0            |
| <input type="checkbox"/> Pro Tier        | <input type="checkbox"/> City dashboard + predictive insights | <input type="checkbox"/> \$499/month    |
| <input type="checkbox"/> Enterprise Tier | <input type="checkbox"/> Insurance + property API             | <input type="checkbox"/> Custom pricing |

# Go-to-Market Plan

**Phase 1: Pilot with FIU Civil Engineering Dept. + test in Little River**

**Phase 2: Partner with Miami-Dade Office of Resilience**

**Phase 3: Expand to Broward & Palm Beach counties**

This phase focuses on research and development, with a specific pilot test in the Little River area of Miami.

- University-led research:** FIU's Civil Engineering department would lead the development and testing of solutions for climate-ready infrastructure. FIU has existing research institutes, like the Institute for Resilient and Sustainable Coastal Infrastructure (InteRaCt), that are designed to find engineering solutions for aging and vulnerable infrastructure.
- Testing site:** The Little River Adaptation Action Area, located in Miami-Dade County, has been a key site for planning and pilot projects aimed at localized sea level rise strategies. Initiatives here include investigating septic-to-sewer conversion and creating "blue and green spaces" for water retention.

After a successful pilot, the project scales up through a formal partnership with the Miami-Dade Office of Resilience.

- Expansion of scope:** Miami-Dade County's Office of Resilience has a wide-ranging program to address climate change impacts like sea-level rise and extreme heat, and it already collaborates with FIU. This partnership would allow the solutions developed by FIU to be integrated into larger, county-wide resilience strategies.
- Shared resources:** The collaboration would leverage the resources of both organizations. The Tech Hub project, which FIU is part of, has received millions in grant funding from the U.S. Department of Commerce to support resilient infrastructure.

In the final phase, the initiative is expanded to cover the broader South Florida region.

- Regional collaboration:** The expansion would include Broward and Palm Beach counties, building on existing partnerships. These counties are part of the larger regional **Risk and Resilience Tech Hub** alongside Miami-Dade, and the program is designed to scale solutions across the entire region.
- Large-scale implementation:** By expanding, the project would transition from a localized pilot to a regional implementation effort. This would allow the tested technologies and strategies to be commercialized and scaled to benefit a much larger population.

# Competitive Advantage

- ✓ Localized data model — built *for* Miami
- ✓ Community-powered reports — real-time accuracy
- ✓ No-code & scalable — fast deployment
- ✓ Civil-engineering expertise — validated design

FEMA's disaster management tools are designed for the specific federal, state, and local government structure of the United States. Global tools, such as those used by the United Nations Office for the Coordination of Humanitarian Affairs (OCHA), are built to handle international coordination across diverse governmental and non-governmental actors.

- Reduce annual property losses by **10–20%**
  - Protect 2.7M Miami residents
- Support Miami's **2050 climate adaptation goals**
  - Bridge citizens, engineers, and policymakers

# EmpowHer Mini HackDAY 2025 – In-Person at Florida International University - FIU (Oct 18)

FLORIDA INTERNATIONAL UNIVERSITY, 11200 SW 8th St, Miami, FL 33199, MIAMI, 33199

Mostafa is a civil engineer and researcher specializing in flood risk mitigation, natural hazards, and resilient infrastructure. At FIU, he works on innovative approaches to urban resilience and community-based adaptation strategies for coastal cities like Miami. He founded **FloodGuard Miami** to bridge the gap between scientific data and real-world preparedness — empowering residents and city planners to predict, prepare for, and prevent flood damage through data-driven solutions.
